Abstract

This article deals with the methods of acquiring English with Internet and some commonly known applications to use.

Keywords: Internet, error-free, access, skill, download, service.

Introduction

The life of a modern person is difficult to imagine without computers and the Internet. Nowadays, almost everything is connected with computers. The computer represents one of the most amazing and significant human achievements. The use of a computer as a tool for working with information is very diverse and multifaceted. Whatever you do - draw, write, count, play - the computer obediently executes your commands. It has a high speed, does not get tired, stores large amounts of information. The computer receives the information, processes it and outputs the result. He can look through the electronic library in a few seconds and find the required information. The computer helps you, teaches, entertains. Many computers around the world are connected in a special way into computer networks. The Internet is the most popular. With its help, a large amount of information is transmitted, magazine articles, business letters, poems and prose, opinions and views, games and jokes, in a word, everything that can be converted into computer information and sent over communication channels. At the same time, you are guaranteed a quick and error-free exchange of information, quick access to it and its processing. Now the Internet has great information capabilities and no less impressive services. The Internet creates a unique opportunity for foreign

language learners to use texts, listen and communicate with native speakers. With the development of the Internet, the opportunities for learning English have increased significantly. Due to the fact that English is spoken in many parts of the world. The Internet space is filled with information in English, which also plays a teaching role. It is the Internet that is considered the technical breakthrough of the last decades, which had a very strong influence on the development of educational technologies. In addition to the fact that a lot of recommendations and educational materials are posted on the Internet, the technical capabilities of the World Wide Web provide an opportunity to conduct educational classes directly on the network. On the net you can find almost all methodological materials for learning English, online tests and multimedia materials. All this is widely used in the study of English. The Internet space allows you to immediately put into practice your knowledge of the English language online. With the help of the Internet, a person can communicate with residents of various countries and representatives of various ethnic and cultural communities, thus not only improving their knowledge of the language, but also improving the skills of understanding English speech among representatives of various peoples. With the help of online communication, a person does not need to simulate a situation or a role-playing game, since he is already in live communication. Also, many English teachers recommend using the Internet to manipulate speech etiquette formulas, We can use the Internet: -for independent search for information as part of the work on the topic of the lesson;

- For independent study;

- For self-preparation for examinations. In addition, during extracurricular time, you can independently work on improving your knowledge in the field of a foreign language. To do this, there are many different courses in the networks for different categories of students, designed for self-education or learning under the guidance of a teacher. Participation in chats, in which teenagers from different countries of the world take part, is an additional, very interesting and useful opportunity for new contacts in real speech practice. So far, this type of language learning has not been sufficiently studied, but it is only a matter of time. During discussions, conversations, there is not only an exchange of information on a particular problem, but also acquaintance with some elements of another culture. The Internet is a universal means of finding information and transferring knowledge. The indisputable advantage of the Internet is that it is an inexhaustible source of information on any issue. I have researched several sites that can help you learn and improve your English. The most popular sites for language learning:

1. www.busuu.com
2. Lingualeo.ru
3. abc-english-grammars
4. alleng.ru
5. <https://www.duolingo.com/>
6. <http://begin-english.ru/>
7. <http://www.learnenglish.de/>
8. <http://situationalenglish.blogspot.ru/> and others. (Attachment 1) Thus, using the information resources of the Internet, you can achieve the following results:

- a) Learn to read correctly;
- b) Improve pronunciation skills;
- c) Improve grammatical skills;
- d) Expand your vocabulary;
- e) Get acquainted with cultural knowledge, including speech etiquette, features of the speech behavior of various peoples in the conditions of communication, cultural features, traditions of the country of the language being studied. The rapid development of the Internet has significant costs. The modern scientific and educational information environment is characterized by a large number of educational resources with unstructured and, moreover, not always reliable information. The volume of such resources is growing exponentially. Thus, the need to ensure the effective use of information scientific and educational resources is steadily increasing. In addition, along with useful and necessary information, users are faced with resources containing unethical and aggressive content that students can come into contact with. The uncontrolled distribution of inappropriate content is contrary to the goals of education and upbringing of young people. It is pointless to refuse the benefits of information technology, but uncontrolled access to the Internet can lead to a number of problems:

- Cyber dependencies;
- Infection with malware when downloading files;
- Violation of normal development.

The study showed that the use of computer technology is not only a source of pleasure, but first of all, it is a way of obtaining information. Many have the skills to work in various computer programs, create computer presentations, communicate on the Internet. We have compiled an analysis of educational Internet sites. By teaching authentic language, the Internet helps build conversational skills, as well as teaching vocabulary and grammar, providing genuine interest and therefore efficiency. Moreover, the Internet develops skills that are important not only for a foreign

language. This is primarily associated with mental operations: analysis, synthesis, abstraction, comparison, comparison, verbal and semantic forecasting, etc. Thus, the skills and abilities formed with the help of Internet technologies go beyond the limits of foreign language competence even within the framework of the –language aspect. The Internet develops the social and psychological qualities of students: their self-confidence and their ability to work in a team; creates an environment conducive to learning, The hypothesis is conclusive and appropriate: If the Internet has a good effect on the learning process of students, then it can be introduced into the curriculum, ultimately this will speed up the learning process, but in no case will it replace live communication between a teacher and a student. In this age of high technology, computers play a huge role in learning English, as there is an interesting and useful opportunity for new ways of gaining knowledge. Thus, we came to the conclusion that the Internet can really help and speed up the process of learning a foreign language.
