Annotation

This article discusses the technology of collaboration and its impact on the education of young people.

Keywords: cooperation technology, pedagogical cooperation, interactive methods.

Introduction

"We all understand well that education is the most important priority issue of any country and society, which solves not only today, but also tomorrow. Therefore, in our country, a huge opportunity is being focused on this issue at the state level"

We must not forget that the foundations of our future are created in the fields of knowledge, in other words, the future of our nation depends on the education and upbringing of our children. In today's developed Uzbekistan, updating the content of education based on the requirements of the times is one of the urgent tasks before the science of pedagogy. In this regard, the importance of cooperative education technology is important. Through the psychology of cooperative education, under the guidance of a teacher, a coach, pupils and students develop the ability to develop independent thinking, creativity, and the factors that shape and enrich the spiritual worldview.

Today, the characteristic of collaborative technologies in the educational process is an innovative approach. The expression of social engineering thinking in pedagogy is a concept related to bringing the process of teaching and upbringing to a certain level to a standard state and creating its optimal project. Today's young generation differs from the youth of yesterday and before, they are growing up as young people who creatively participate in the development of the times with the ability to think independently in social life and find timely solutions to some urgent problems.

A person is educated by society. Therefore, education in society should be aimed at a rational goal. Today, under the leadership of our honorable president Sh.M. Mirziyoev, all-round opportunities are being created for youth education in our republic. Setting goals of educational technologies in collaboration with teachers and trainers in educational institutions serves to realize specific educational goals.

- The unique feature of cooperative education technology is that the educational process is designed and implemented in order to achieve a guaranteed result of the goals of cooperative education. In this, the activities of the teacher, pupil, and student are directed to a specific goal. Goal-orientation makes it possible to diagnose the educational process, to divide the educational process into parts that affect it separately, to improve it, to spend less time and achieve high results.
- Pupils, students, graduate students move from a passive activity to an active subject. Planning the organization of educational influence on a technological basis requires highly competent skills from the pedagogue. After all the planned spiritual and educational activities are ready, the teacher-coach mainly performs the task of organization.
- Today, in the era of rapid development of innovative technologies, the following can be included in the educational technology;
 - - Development of educational goals;
 - - Turning educational goals into control tasks;
 - - Systematization of the implementation of educational goals;
 - - Ways to achieve the goal;
 - - Evaluation of the achieved goal;
- The formation and organization of the process of pedagogical cooperation in educational technology is based on the following principles:
 - - The principle of holistic approach to education;
 - - The principle of continuous education;
 - - Joint activities of pedagogues and educators

Each of these components constitutes a system of using pedagogical situations in the field of education.

The process of education is a continuous process that takes place in the family, community, school, and university. In the technology of cooperative education, there is a clear goal-oriented relationship between the teacher and the teacher. A pedagogue must be a highly competent person in order to understand the technologies of education and to approach them creatively, to effectively use organizational forms, tools and methods of education and to manage it. Because the decree No. PF5558, adopted by our president on September 5, 2018, showed today's teacher that he has to perform very important tasks, that is, to improve the quality of education. This requires today's pedagogues to create new educational technologies and use them in the education of the young generation. Ensuring the continuity of education and organizing it in the form of a system is one of the main tasks in educating young people, who are the future of our country, as well-rounded people.

Today, one of the main tasks is to organize the cooperative education methods inherited from our ancestors in a modern form. Today, the cooperative education methods inherited from our ancestors are implemented in a modern form. The school, neighborhood, family, higher education, and production communities participate in this. In pedagogical cooperation, spiritual and educational dialogues with the agreement of parents of pupils and students are of great importance.

These include:

- A. Deep and thorough mastery of the basics of science;
- B. Cultivation of high moral quality and sophistication of young students;
- V. Reasonable supervision of children's activities;

In addition to the above, pedagogues in schools and universities can also organize organizational work with parents:

1. Inviting parents to meetings in educational institutions every quarter;
2. Inviting parents to the educational process in educational institutions;
3. Representatives of educational institutions visit hostels where students live, houses where young people live, and get information about their activities;
4. To study the conditions of the apartments where young students live and to provide them with moral and material support;

Cooperation in the implementation of technology is carried out mainly in 3 directions:

1. Involvement of pupils and students in social life;
 2. Educating politically active citizens with a legal culture and broad worldview;
 3. To educate young people as patriots who believe in the greatness of the future of Uzbekistan;
1. In today's rapidly developing continuous education system, the purpose of educational work in extracurricular activities is not only to keep young people busy, but also to increase their interest in our national values based on the knowledge they have acquired during the training. as in the organization of educational work, a responsible approach is required.
 2. Today, our pedagogues use the following interactive methods of cooperation technology: "Cluster", "Boomerang", "Brainstorming", "Perceptual map", "Fish skeleton", "Ansurli saw", "BBB", "KBI" and many others. are achieving positive results. In particular, professors and teachers of TerDU are organizing targeted roundtable discussions with students' parents based on cooperation technologies, discussions about spiritual and educational work of students after class. Spiritual and educational activities in student youth hostels on a systematic basis in cooperation with professors and teachers; "I love the book", "Uzbekistan is my country", "I like A. Qadiri's novel "Bygone Days", "What are your thoughts about

today's energetic youth", "What can you say about today's heroes?", "You question-and-answer evenings on "how do you analyze the concept of a healthy environment", "what do you think about a modern teacher" and other topics are being organized in cooperation. In Alisher Navoi's work "Mahbub-ul-Qulub", "His job is not a person, but a strong person who could not even say that he was powerless to take care of a young child. And he teaches science and manners to a bunch of children. Today's modern teacher must have methodological conceptual knowledge, competence, skills and competence pedagogical skills for successful implementation of education. Of course, these spiritual events serve as mentors, students, young poets of our time, to acquire the culture of reading books to the heroes of the work and, at the same time, to think independently. So, if our today's skilled teachers use cooperation technologies purposefully and systematically, they will achieve the following results:

3. Pupils think more on the basis of their own ideas, and in turn, they enter into a communicative relationship with their students;
4. Collaborative technologies can be organized in small and large groups. During the conversation, the groups have a sincere relationship with each other and respectfully listen to each other's opinions;
5. The center of attention shifts from the pedagogue to the student and they manage each other;
6. "It is necessary to give more responsibility to students to activate them"
7. Explain how the acquired experiences can be used in life;
8. Recognition, approval and healthy competition.

Today's pedagogue, coach should pay attention to the following pedagogical requirements when organizing spiritual and educational events:

- The student should be suitable for the age and mentality of the student;
- It should serve to strengthen the knowledge acquired during the educational process;
- Events should be organized with a clear plan and purpose;

As a conclusion, if a competent pedagogue uses educational methods effectively and uses information technologies appropriately, this in turn ensures the smooth passage of spiritual and educational events. Today, our main goal is to educate the young generation on the basis of the heritage of our great scholars, customs, traditions and customs of the Uzbek people. The effectiveness of these is that the entire educational process in the continuous education system has one goal: spiritual and ideological education of students, education of the young generation that serves to strengthen

independence, which helps to determine the level of spiritual maturity of students and students.
